Exp 6: Building Anonymous FTP Scanner using FTPLIB Module.

Aim:

To build an anonymous FTP scanner using Python's ftplib module to detect open FTP servers that allows anonymous login.

Procedure:

1) Import ftplib, socket, and concurrent.futures modules.

2) Define a function anon_ftp_scan(ip) that attempts anonymous FTP login.

3) Call ftp.login('anonymous', 'anon@example.com') for anonymous login.

4) Print the IP, welcome message, and available files.

5) Use ThreadPoolExecutor to scan multiple IPs concurrently.

6) Create a list of IP addresses to scan (use lab network range).

7) Run the scanner and record results.

OUTPUT:

```
import ftplib, socket
from concurrent.futures import ThreadPoolExecutor
def anon_ftp_scan(ip):
    try:
        ftp = ftplib.FTP(timeout=3)
        ftp.connect(ip, 21, timeout=3)
        files = ftp.nlst()
        ftp.quit()
        return True
    except ftplib.error_perm:
        pass # port closed or unreachable
    return False
```

8) Use ftp.quit() to properly close each connection.

Result:

The anonymous FTP scanner was implemented successfully. Open FTP servers allowing anonymous login were identified and directory listings were retrieved from accessible servers.
